Angular Application Deployment Report

Vercel Deployment Procedure

Project Name: NaturalFarm **Platform:** Vercel

Framework: Angular **Deployment Type:** Continuous Integration via GitHub

1. Overview

This report documents the standard procedure executed to configure, compile, and deploy the NaturalFarm Angular web application to Vercel using continuous integration from GitHub.

2. Deployment Procedure

Step 1: Create Vercel Configuration File

Create a `vercel.json` file in the root directory of the project to define the build command, output directory, and client-side routing rewrites:

```
{
  "buildCommand": "npm run build",
  "outputDirectory": "dist/NaturalFarm",
  "rewrites": [
    {
      "source": "/(.*)",
      "destination": "/index.html"
    }
  ]
}
```

Step 2: Verify Local Production Build

Execute the production build command in the terminal to compile the application into static production assets:

```
npm run build
```

The compiled production files are generated in the output directory: `dist/NaturalFarm`.

Step 3: Commit and Push Code to GitHub

Stage, commit, and push all configuration and project changes to the main branch on GitHub:

```
git add .
git commit -m "Configure Vercel deployment settings"
git push origin main
```

Step 4: Connect Repository and Deploy on Vercel

- Log in to the Vercel Dashboard.
- Click **Add New...** > **Project**.
- Select and import the **NaturalFarm** GitHub repository.
- Vercel automatically detects the Angular framework and reads the settings from `vercel.json`.
- Confirm that the **Output Directory** is set to `dist/NaturalFarm`.
- Click **Deploy**.

3. Summary

Upon deployment, Vercel runs `npm run build`, pulls the generated production assets from `dist/NaturalFarm`, and serves the application live on a production URL.
